

FAIR Evaluation Report

Name: Anish Amol Gaware

Subject: Data Management

Dataset Information

- **Title:** Data from: Exogenous testosterone increases the audience effect in healthy males: evidence for the social status hypothesis
- **DOI:** 10.5281/zenodo.3967913
- **Source:** <https://zenodo.org/records/3967913>

Principle	Score	Level
Findable	7 / 7	Advanced
Accessible	6 / 7	Advanced
Interoperable	4 / 6	Moderate
Reusable	5 / 6	Moderate

Interpretation of Results

Findable:

The dataset is highly findable due to the presence of a globally unique DOI and rich metadata including title, authors, and description.

Accessible:

The dataset is openly accessible via Zenodo without any authentication or paywall, using standard web protocols.

Interoperable:

The dataset uses common file formats but lacks standardized semantic metadata and ontology mapping, limiting interoperability.

Reusable:

The dataset provides strong scientific context and references to research work, but lacks detailed machine-readable documentation.

Strengths

- Persistent identification using DOI ensures long-term findability
- Strong scientific context and research backing improves reusability

Improvements

- Improve interoperability by linking data to standard ontologies
- Add structured, machine-readable metadata (e.g., JSON/XML)

Conclusion

The dataset performs well in **Findability and Accessibility** due to its DOI and open access nature. However, improvements in **Interoperability and Reusability** would enhance its FAIR compliance.

Report:

Findable

FsF-F1-01MD - Metadata and data are assigned a globally unique identifier.	✓	▼
FsF-F1-02MD - Metadata and data are assigned a persistent identifier.	?	▼
FsF-F2-01M - Metadata includes descriptive core elements (creator, title, data identifier, publisher, publication date, summary and keywords) to support data findability.	✓	▼
FsF-F3-01M - Metadata includes the identifier of the data it describes.	✓	▼
FsF-F4-01M - Metadata is offered in such a way that it can be registered or indexed by search engines.	✓	▼

Accessible

FsF-A1-01M - Metadata contains access level and access conditions of the data.	?	▼
--	---	---

Accessible

FsF-A1-01M - Metadata contains access level and access conditions of the data.	?	▼
FsF-A1-02MD - Metadata and data are retrievable by their identifier	✓	▼
FsF-A1.1-01MD - A standardized communication protocol is used to access metadata and data.	✓	▼
FsF-A1.2-01MD - Metadata and data are accessible through a standardized communication protocol which supports authentication.	✓	▼

Interoperable

FsF-I1-01M - Metadata is represented using a formal knowledge representation language.	✓	▼
FsF-I2-01M - Metadata uses registered semantic resources	?	▼
FsF-I3-01M - Metadata includes qualified references between the data and its related entities.	?	▼

Data from: Exogenous testosterone increases the audience effect in healthy males: evidence for the social status hypothesis

Wu, Yin¹

Show affiliations

Several studies have implicated testosterone in the modulation of altruistic behaviours instrumental to advancing social status. Independent studies have also shown that people tend to behave more altruistically when being watched (i.e., audience effect). To date, little is known about whether testosterone could modulate the audience effect. In the current study, we tested the effect of testosterone on altruistic behaviour using a donation task, wherein participants were asked to either accept or reject a monetary

transfer to a charity organization accompanying a personal cost either in the presence or absence of an observer. We administered testosterone gel or placebo to healthy young men (n = 140) in a double-blind, placebo-controlled, mixed design. Our results showed that participants were more likely to accept the monetary transfer to the charity when being observed compared to when they completed the task alone. More importantly, this audience effect was amplified among people receiving testosterone vs. placebo. Our findings suggest that testosterone administration increases the audience effect and further buttress the social status hypothesis, according to which testosterone promotes status-seeking behaviour in a context-dependent manner.
